

## How AI and Online Game Play Will Change the World of Education

As the downing trend of SAT scores fast becomes a national epidemic, the traditional education paradigm must shift. Enter technology that allows students to help each other, learn through playing games, and provide individualized analytics that optimizes how each student studies. Our company is a new online service and education methodology developed to optimize the way students naturally study. It is poised to change the educational paradigm as its fun and engaging test prep games encourage peer-to-peer learning and keep students actively studying for hours at a time. It also combines a virtual study group format with multi-player game dynamics to provide an engaging live collaborative learning environment for geographically dispersed learners. It creates a social community amongst students who are studying together by connecting them through chat features, leaderboards and profile pictures. Our company currently offers test prep services for the SAT and GMAT, but will expand its offerings in the coming months. Students are even able to track their progress and strengths and weaknesses using our adaptive technology. Our Analytics reveals a student's strengths and weaknesses and using AI, we provide students with questions that will optimize their study time. Audience members will have the opportunity to take a trial run and play games alone, play with each other, and chat with each other within the game. With SAT scores dipping lower than ever, we must seek out new and better ways to help students learn.
